

BTC INVESTMENT TRANSACTION & PAYMENT COMPLIANCE ADDENDUM

CRYPTOCURRENCY SETTLEMENT ARCHITECTURE

DOCUMENT REFERENCE: BB-BTC-COMP-0426-V5

TARGET ACQUISITION: \$80,000.00 USD Prop Trading Allocation

SETTLEMENT AMOUNT: \$18,000.00 USD equivalent in Bitcoin (BTC)

NETWORK STANDARD: Bitcoin Mainnet (Layer 1 Base Layer)

COMPLIANCE PROTOCOL: Verification, AML Blockchain Screen & Finality
Settlement

SYSTEM RECORD DATE: 20th May, 2026

BITCOIN SETTLEMENT & COMPLIANCE ADDENDUM

FRAMEWORK FOR CRYPTOGRAPHIC ASSET LIQUIDATION & ONBOARDING

This Bitcoin Investment Transaction & Payment Compliance Addendum (the "Addendum") is executed and made effective as of **20th May, 2026**, and acts as a binding technical extension to the BUYBIT Master Framework governing the allocation of proprietary trading assets.

WHEREAS, the Trader has elected to settle the required proprietary account allocation acquisition fee utilizing cryptographic assets, specifically Bitcoin (BTC), to the value of exactly **\$18,000.00 USD**; and

WHEREAS, the Platform requires strict compliance parameters to govern digital ledger allocations, address safety, anti-money laundering blockchain evaluation, and transactional finality to prevent network manipulation or regulatory discrepancy;

NOW, THEREFORE, the parties agree to the following technical, financial, and regulatory legal covenants:

SECTION 1: TRANSACTION BREAKDOWN & VALUE PEGGING

The cryptocurrency deposit is evaluated and confirmed based on the spot exchange rate at the specific timestamp of cryptographic blockchain inclusion. The transaction parameters are designated below:

Compliance Parameter	Institutional Specification	Technical Protocol Requirement
Target Settlement Value	\$18,000.00 USD	Fixed fiat equivalent valuation for the \$80,000 capital asset slot.
Asset Classification	Bitcoin (BTC)	Native layer-1 network transaction only. Wrapped or sidechain assets are excluded.
Exchange Pricing Engine	Institutional Volume-Weighted Average Price (VWAP)	Calculated using the consolidated live index rates of major regulated spot books at confirmation time.
Network Confirmations	3 Standard Blocks	Required baseline node consensus propagation before provisioning is authorized.

SECTION 2: BLOCKCHAIN ADDRESS & TRANSACTION ROUTING

2.1 Secure Provisioning Source: The official, unique, and dynamic Bitcoin destination address assigned to this specific payment transaction will be explicitly generated and provided exclusively via the integrated broker platform site interface. No other communication channels are authorized to provide settlement coordinates.

2.2 Anti-Phishing & Verifiability: The Trader is required to verify the wallet address details directly on the broker site prior to committing or initializing the transaction on the Bitcoin network. The Platform shall not provide destination wallet strings through manual emails, chat spaces, or external staff directives.

2.3 Transfer Liability: The Trader maintains sole, exclusive responsibility for ensuring correct network selection and precise string matching when inputting the address from the broker site. Cryptographic transmissions routed to incorrect destination addresses are structurally irreversible, and the Platform bears no indemnification liability for misplaced network assets.

CRITICAL SAFETY MANDATE: To ensure protocol security and circumvent phishing vectors, never accept destination wallet updates or custom address modifications outside the official broker platform site. The system-generated address on the site remains the sole legally recognized destination for settlement data tracking.

SECTION 3: ANTI-MONEY LAUNDERING (AML) & ORIGIN ANALYSIS

3.1 On-Chain Risk Scoring: All inbound transactions undergo structural ledger analysis through automated blockchain risk-mitigation tooling. Inbound wallets exhibiting high-risk associations (including illicit coin mixing pools, sanctioned addresses, or documented darknet vulnerabilities) will be immediately quarantined.

3.2 Verification Flags: If an automated compliance trigger occurs, the account setup parameters are automatically paused until additional proof-of-source documentation is uploaded and authenticated by the compliance officer.

SECTION 4: VALUE FLUCTUATION & SLIPPAGE BOUNDARIES

4.1 Slippage Bandwidth: A standardized cross-network execution window of +/- 1% is tolerated between transaction dispatch and block confirmation.

4.2 Deficit Reconciliation: In the event that catastrophic network volatility or extended block-time lag reduces the confirmed fiat equivalent below \$17,820.00 USD at the final verification timestamp, the Platform reserves the right to request a micro-balance transaction from the Trader to meet the required baseline before trading system credentials are issued.

SECTION 5: FINALITY & ACCESS PROVISIONING

Upon receipt of three (3) standard network validations and successful clean AML blockchain risk scoring, the system will mark the payment status as fully settled. The Platform shall execute access token provisioning for the \$80,000.00 USD account structure within twenty-four (24) business hours of confirmation.

I, the Trader, have read thoroughly, understood, and do hereby agree to be legally bound by all terms, verification conditions, network finality metrics, and policies outlined within this Bitcoin Investment Transaction & Payment Compliance Addendum.

System Authorization Node: Verified via Platform UI Compliance Module
